# How to find information about a computer in a Workgroup

## How to find information about a computer in a Workgroup

I'm in a Workgroup with other computers. How can I find information about other computers in the same Workgroup?

## Context

Windows

## Solution

1. Start up the command prompt (Go to **Start > Run**, type in cmd and click **OK**).
2. In the command prompt type in:

```
nbtstat -a "computer name"
```

This command should return the MAC address of the computer that uses this NetBIOS name.

The output looks like this:

```
Wireless Network Connection 2:
Node IpAddress: [18.152.5.66] Scope Id: []
```

```
NetBIOS Remote Machine Name Table
       Name               Type         Status
    ---------------------------------------------
    PCS-GX280      <20>  UNIQUE      Registered
    PCS-GX280      <00>  UNIQUE      Registered
    WORKGROUP      <00>  GROUP       Registered
    MAC Address = 00-11-43-1D-94-92
```
