The `google-sidebar` macro inserts a panel on a page that displays in-line search results from Google and Google with an site:ist.mit.edu restriction using the Google search API. It pulls its query term from the URL, specifically from the `searchQuery` parameter in the URL. Because of this it really only works on Knowledge Base search results pages. It is called from the `sidebar` macro, which pulls in different sets of sidebar panels depending on which page it is on. The `google-sidebar` macro is currently displayed on the Knowledge Base Search Results page. It is called with code like this:

```
{google-sidebar}
```

from the `sidebar` macro. If it is used on page that does not pass any query parameters, it will display an informative message of what it would do if it had search terms.
