FSILG Network Information

Spring 2017 update:

IS&T has recently taken ownership of FSILG network infrastructure and is responsible for maintaining the network switches and equipment that have been installed in each house/building. IS&T is only responsible for maintaining the wired/wireless switches, wireless access points (WAP), and connectivity of the house to MITnet. Houses are responsible for maintaining any wiring/cabling from the network jacks in the wall back to the switches. If there is an issue with the network the house should notify IS&T (servicedesk@mit.edu). Note: IS&T staff cannot gain access to a house without a house member's presence.

More information about FSILG network infrastructure maintenance and responsibilities can be found in the Network Management Program (NMP) Terms of Service on the AILG web site.
