How much quota am I using in my Athena home directory?

To check the quota on your home directory, you can simply type "quota -v":

```
joeuser@athena:~$ quota -v -f $USER
```

Disk quotas for joeuser (uid 17261):

<table>
<thead>
<tr>
<th>Filesystem</th>
<th>usage</th>
<th>quota</th>
<th>limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>/mit/joeuser</td>
<td>42072</td>
<td>150000</td>
<td>150000</td>
</tr>
</tbody>
</table>

Here is what some of the columns mean:

- **usage**: how much space you are using in Kilobytes (Kb)
- **quota/limit**: the maximum amount of space allotted

The 3 rightmost columns are obsolete and can be ignored.

(Note: In NFS, quota and limit were used to indicate "soft limit" and "hard limit", respectively. However, there are no soft limits in AFS, and both entries report the same information.)
