How do I use MIT's PGP Desktop for Windows to whole disk encrypt external storage drives?

Q: How do I use MIT's PGP Desktop for Windows to whole disk encrypt external storage drives?

PGP is no longer being offered on the software grid. Support is being phased out and will discontinue at the end of 2016.

Answer

PGP Desktop allows you to encrypt disks, other than just your computer's internal hard drive, using Whole Disk Encryption. This includes USB flash drives and external portable storage devices. It is especially important to encrypt these devices if they contain sensitive information, as they are easy to misplace or have stolen and, in the case of external portable hard drives, may be used for backup of sensitive information that you have on your encrypted computer, so they must be encrypted as well.

Warning: After an external portable hard drive or USB memory stick is encrypted using PGP Whole Disk Encryption, any computer that you want to use to access your portable storage MUST have PGP Desktop installed.

To create an encrypted disk:

1. Double click the **PGP Desktop Lock icon** in the system tray (lower right hand corner).

2. Click PGP Disk from the menu on the left and click "Encrypt Whole Disk...".

New Virtual Disk

New Virtual Disk

You may create as many virtual disks as necessary, each encrypted to different lays or settings. While mounted the disk behaves like an additional hard disk, available to you. Unmounting your disk makes it unavailable through Windows and any contents are kept PGP encrypted even if someone gans access to your machine.

Encrypt Whole Disk

Encrypt Whole Disk

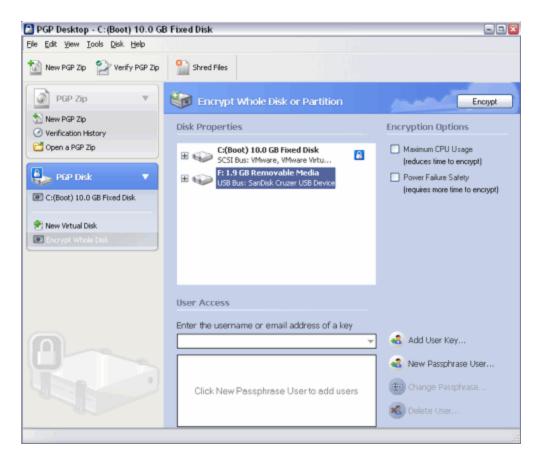

Encrypt Whole Disk or Partition

PGP provides the next level of security by encrypting your entire physical drive. Everything on your disk will be encrypted including your operating system, settings and caches - should you have been fail into the wrong hands it will not be bootable. You now have the option of selecting individual partitions, helpful in a multi-boot configuration.

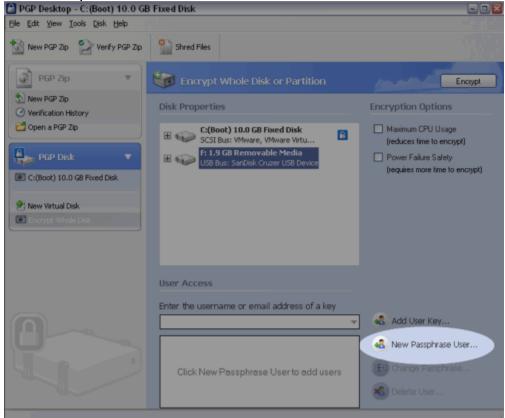

Shired Free Space

PGP Shredder can when the fire space available on your disk. This is important if you have used the Pecycle fin to delete any sensitive data. Use this option to securely and permanently shred all traces of files or rolders you have previously deleted.

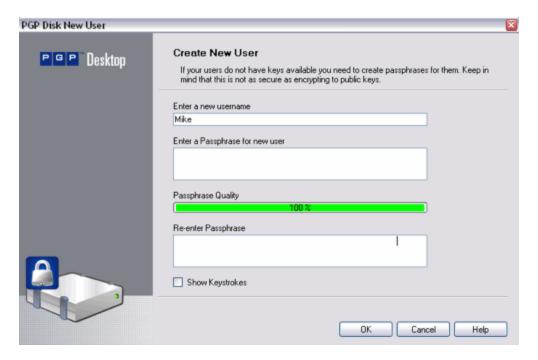

3. **Select the device** you want encrypted in the Disk Properties window.

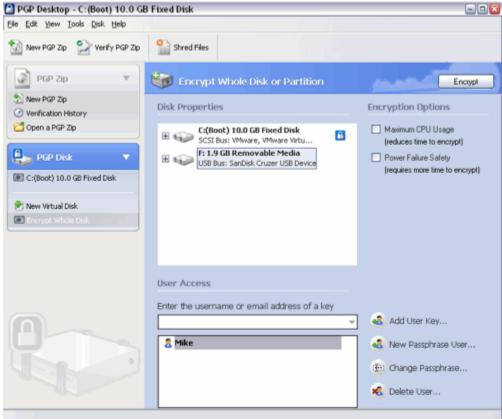

4. Click New Passphrase User...

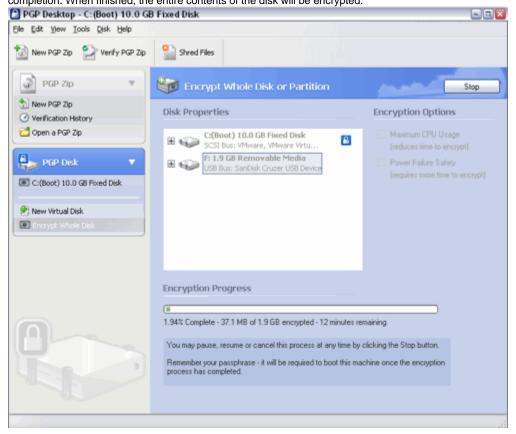

5. Enter a username and a strong passphrase. A whole sentence is best. Remember, this is the only thing that keeps the data protected. You will not see the password as you type it unless you select "Show Keystrokes". Click **OK**.

6. Once the device you want encrypted is selected and a Passphrase User has been created, click the **Encrypt** button in the upper right corner of the window.

Result: PGP Desktop will begin encrypting the disk. The status of the encryption progress will be shown, as well as an estimated time to completion. When finished, the entire contents of the disk will be encrypted.
