How can I get another Terminal window?

Q: How can I get another Terminal window?

Answer

You can open a Terminal window by selecting the Applications menu, then Accessories, then Terminal. You can also open a new terminal window from an existing one by choosing "Open Terminal" from the File menu or by pressing Ctrl-Shift-N.

Lastly, you can type `gnome-terminal &` at your shell prompt.

You can also use the "xterm" program, which is an older, but in some cases more customizable, terminal window. To get a new xterm, simply type `xterm &` at your shell prompt.
