# Jamf Pro - Mobile Device Configuration Profiles

## Jamf Pro - Mobile Device Configuration Profiles

You can apply configuration profiles to your devices. Configuration profiles allow you to:

- Set passcode requirements
- Set up device restrictions (remove access to app store, disallow usage of safari and other apps, etc.)
- Configure email - See our email configuration page for settings
- Many other settings

To create a configuration profile in the JSS:

1. Click on **Mobile Devices** at the top
2. Click **Configuration Profiles** on the left
3. Click **New**
4. Click the desired command
5. Configure as desired - Be sure to set:
    - Name
    - Category
    - Distribution Method
    - Scope
    - Settings desired for payload

Configuration profiles should be done with great care as they can lock out device functionality needed by your end users. You should apply settings on a test device to ensure they do what you want them to.
