bs

The "bs" macro is used to escape characters with a backslash. In wiki markup, the backslash (\ ) is often interpreted by Confluence directly and thus may not display in the final markup. The "bs" macro fixes this.

Parameters:

The first unnamed parameter is the text to backslash. If omitted, the macro will render a double backslash instead.

The named parameter "tt" can be set to false to cause the text to display in the current font rather than a monospace font.

Examples:

```
Monospace double backslash: {bs}
Regular double backslash: {bs:tt=false}
Monospace backslashed "a": {bs:a}
Regular backslashed "a": {bs:a|tt=false}
```

results in

```
Monospace double backslash: \ \
Regular double backslash: \\
Monospace backslashed "a": \a
Regular backslashed "a": \a
```
