

MIT SECURE wireless - Windows Security Alert

MIT SECURE wireless - Windows Security Alert

Question

Why do I get a Windows Security Alert when I try to connect to the MIT Secure wireless network?

Answer

The security alert lets you know that the RADIUS authentication server you are connecting to is not necessarily a trusted source. This is because your computer does not know the name of the RADIUS server used by the MIT SECURE network. Thus, it has no way to distinguish between an untrusted RADIUS server used by a fraudulent wireless network masquerading as the true MIT SECURE network.

You can connect to the MIT SECURE network by confirming that you are communicating with the trusted RADIUS server used by the MIT SECURE wireless network. To do this:

1. Open the **Details** for the security message.
2. Confirm that the RADIUS Server is **oc11-radius-wireless-1.mit.edu** or **w92-radius-wireless-1.mit.edu**
3. Confirm that the Root CA is **AddTrust External CA Root** (the screen shot differs as it recently changed).
4. If the above matches the certificate details displayed on your computer, then you can safely click **Connect** and use the MIT SECURE wireless network.

If the information does NOT match, click **Terminate** and notify the [Service Desk](#) or the [Security team](#).
