What is Citrix?

Citrix is a universal client for accessing desktop applications via a server solution. MIT's Citrix implementation allows users to access Windows-only enterprise applications, such as BrioQuery, in a remote desktop environment. Applications such as Adonis and SAPgui are also hosted on the MIT Citrix servers, and are accessed by both Macintosh and Windows users.

Installation and first launch

- You must uninstall all previous versions of the Citrix receiver in order to open Citrix apps. Note the Citrix version you may have from a previous institution is not guaranteed to work with our Citrix servers.

- [Citrix Workspace for Windows Installation and First Launch](#)

Using Citrix to access applications

1. Navigate in your web browser with certificates to <http://citrixapps.mit.edu>.
With the Citrix Receiver client successfully installed, you should see the following logon prompt:

2. Enter your Kerberos username (portion of your MIT email address before the @mit.edu).
3. Enter your Kerberos password (password used to check your MIT email).
Result: Applications available from the MIT Citrix servers are displayed.
4. Click the icon for your selected application.

Note for off-campus users

To access applications via Citrix from off-campus locations or from a private subnet, you will need to connect to the MIT VPN (Virtual Private Network) before connecting to Citrix.

See: [VPN at MIT](#)

How can I obtain a certificate for Internet Explorer on the Citrix server?

1. Click the Internet Explorer icon to launch IE.
 2. Navigate to <http://ca.mit.edu>
 3. Enter your Kerberos/Athena username and password and your MIT ID.
 4. Click Next and follow the prompts, accepting all default values.
NOTE: There are two Citrix servers. If you access IE via Citrix a second time, and happen to access the other server, you will need to obtain a certificate in IE for that server as well.
- Certificates expire annually at the end of July. You will need to [delete the old certificate](#) and obtain a new one.
