

How can I run ispell inside emacs?

Q: How can I run ispell inside emacs?

Answer

If you are unfamiliar with `ispell`, please see [How can I spell check a file or document?](#).

You can run ispell inside an Emacs buffer with the command:

```
M-x ispell
```

Now the following commands are available for the duration of your emacs session:

M-x ispell-word - Checks word

M-x ispell-buffer - Checks buffer (current file)

M-x ispell-region - Checks region

ispell functions normally inside Emacs, although it uses the minibuffer for commands.
