

How can I spell check a file or document?

How can I spell check a file or document?

Most major applications have their own spell-checking features. OpenOffice's spell-checking feature can be accessed from the "Tools" menu inside OpenOffice. Firefox, Evolution, and many other GNOME applications will check your spelling as you type. Misspelled words will be indicated by a dotted red underline, and you can right-click on those words to see suggested spellings.

To spell-check plain text files, you can use the `ispell` program. `ispell` is a command-line program, so it needs to be run in the Terminal window:

```
joeuser@athena:~$ ispell filename
```

Note: Be sure to fill in the correct information for *filename*.

This will start `ispell` and check the entire file immediately.

When `ispell` finds a word that is not in its dictionary, it will outline the word in reverse video (highlighted). If there are "near misses" in the dictionary, `ispell` will also display the incorrect word and a list of correct alternatives at the top if they exist.

At this point, you can type one of the following characters:

Key	Meaning	Description
r	Replace Word	IsPELL asks you for a replacement word. IsPELL will not check the spelling of the replacement.
1, 2, etc...	Replace Word with suggested word	The suggested replacements at the top of the screen are numbered. If you type a word's number, <code>ispell</code> will use this word as a replacement.
<space>	Skips Word	Leave this word as is. If this word is encountered again, <code>ispell</code> will stop and prompt you for an action.
a	Accept Word	Accept this word as correct for remainder of <code>ispell</code> session
i	Add Word	Add this word to your personal dictionary. This is a file in your home directory called <code>spell.words</code> which tells <code>ispell</code> to accept the word as correct every time you use <code>ispell</code> (useful for things like your name).
<CTRL-G>	Quit IsPELL	You can quit <code>ispell</code> at any time by pressing <code><CTRL-G></code> . This is done by holding down the CTRL key and pressing "G".

The man page on `ispell` lists more options and gives more detailed information on this program.
