Installing Certificates with Android 7.x or Higher

This setup uses Firefox Browser for Android. Please note that Firefox keeps all certificates internally and does not install them on your device. As a result, you must use Firefox to access any certificate-protected MIT sites.

1. Open the Play Store app and search for “Firefox”.
2. Select Firefox Browser for Android and click Install.
3. Once installed, open Firefox.
5. Enter your Kerberos username, password, and tap Next.

Important

*You CANNOT install certificates on the mobile device without creating a passcode for it. This feature cannot be changed as it is an Android design configuration setup by the Android device’s manufacturers. If you prefer to keep your phone unlocked, please do not attempt install certificates on the device.

It is HIGHLY RECOMMENDED to Set up a passcode prior to continuing the installation process.

1. At this point, you will receive a prompt to Authenticate Duo. Make your usual choice for Duo Authentication.
1. Once the installation process is complete, you will be notified that the certificate is installed. Tap OK.

2. Finally, tap to install the MIT Certificate Authority Certificate.

3. You should see a prompt asking you to trust the certificate identity.
4. Check all available boxes that appear and tap OK.

5. Test your certificate by going to Certificate Test Page.

- Your MIT Root and personal certificates will be installed.
