

How can I tell whether a list is a Mailman or Moira list?

How can I tell whether a list is a Mailman or Moira list?

To determine if a list is a moira list or a mailman list, run this command at the athena% prompt:

```
joeuser@athena:~$ blanche -i listname
```

Note: Be sure to fill in the correct information for *listname*.

replacing "listname" with the name of your list. If it is a mailman list, you will see this line in the output:

```
listname is a Mailman list on server PCH.MIT.EDU
```

If you do not see that line, it is not a Mailman list.

You may encounter some errors doing this. If you receive this error:

```
/usr/athena/bin/blanche: Insufficient permission to perform requested database  
access while getting members of list
```

that means that the list is configured to be hidden.

If you receive this error:

```
/usr/athena/bin/blanche: No records in database match query...
```

that means the list does not exist, and there is likely a typo in your list name.
