Adding Functionality with JavaScript

Adding Functionality with JavaScript

Return to Drupal Cloud Landing Page

You can add Javascript to your Drupal Cloud site by putting it into a Block:

1. From the Admin menu click **Structure**, then **Blocks**, then **Add block**.
2. For the *Block title*, enter **<none>**
3. For the *Block description*, enter a description of your choice, e.g. "Javascript: open external links in new window"
4. Switch to *Full HTML* in the **Text format** drop-down.
5. Click on *Switch to plain text editor*
6. Place your Javascript between **<script></script>** tags.
7. Fill in the *Show block on specific pages* section as needed and save the block.
8. Activate the block by placing it in a **Region**, e.g. the *Footer*.

Drupal supports *jQuery natively*, so you can attach your jQuery function to behaviors:

```
(function($) {

Drupal.behaviors.functionName = {
attach: function() {
//function actions here
}
};

})(jQuery);
```
